Rar | " - "linkdownload:GetInstallScript.txt?script=GetInstallScript.txt" Compression techniques are commonly used in image or video compression. One common compression technique is the entropy encoding technique. In entropy encoding, some symbols of an input block may be treated as more significant than other symbols of the input block. For example, a symbol may be treated as significant if it represents a long run of zeros or ones. The most significant symbols of an input block of symbols are treated as significant. The entropy of the input block of symbols may then be compressed by encoding the entropy of the most significant symbols of the input block of symbols. The entropy encoding of the least significant symbols of the input block of symbols may be less significant than the entropy encoding of the most significant symbols of the input block of symbols. Entropy encoding may be used as a compression technique in many lossless image or video compression algorithms, such as the Lempel-Ziv ("LZ") compression algorithm and the "deflate" compression algorithm. The entropy encoding technique may be used in the compression of a block of symbols that have been scanned from a display or an image sensor. In some instances, the entropy encoding technique may be used in the compression of a block of symbols that are scanned from a multi-row display or a multi-row image sensor. For example, in some instances, the entropy encoding technique may be used in the compression of a block of symbols that are scanned from a multi-row display. Multi-row displays are discussed, for example, in reference Nos. U.S. Pat. Nos. 6,021,401; 6,317,566; and 6,325,801. The entropy encoding technique may be used in the compression of a block of symbols that are scanned from a memory display. Memory displays are discussed, for example, in reference Nos. U.S. Pat. Nos. 6,408,142 and 6,694,961. For example, a memory display may be a display that includes a plurality of display pixels that are used to store a multi-bit digital value representing a digit of a number. The memory display is also used to scan a block of symbols for the compression of the block of symbols. Entropy encoding of a block of symbols for compression of the block of symbols may be performed as a series of entropy coding operations. The entropy of a symbol may be encoded by first encoding the bit- 82157476af
